Public Outreach & Engagement: A Primer for Sea Grant Researchers

As marine research addresses issues of social and political concern—climate change, red tide, eutrophication, seafood sustainability, coastal erosion, etc.—scientists are called upon to interact with public audiences. Many granting agencies, including Sea Grant, require an outreach component, and public service is an essential component of a land- and sea-grant university.

Blue Sky Pathway 1. The University of Maine will align its innovation, entrepreneurship and community outreach with the priority economic and cultural needs of Maine. Blue Sky Pathway 3. The University of Maine will create and sustain a continuous culture of community engagement.

–University of Maine 2012-2017 Strategic Plan

What does “outreach” mean for your research topic? The terms education, outreach, community engagement, and public participation are often used interchangeably to describe scientists interacting with public audiences, but they have different meanings depending on context. All of them require communication skills and tools.

Outreach: Activities to enhance awareness of science and research. Implies a one-way delivery of information, or includes an element of education to help public audiences “understand” information. Examples: fact sheet, website, presentation.

Participation: Involvement of stakeholders in science-based policy and management planning and decisions that will affect them, directly or indirectly. Levels of participation vary. Examples: task force, citizen committee, public hearing.

Engagement: The collaboration between institutions of higher education and external communities for the mutually beneficial exchange of knowledge and resources in a context of partnership and reciprocity (Source: Carnegie Foundation). Can be the same as participation and sometimes used interchangeably with outreach, but engagement implies a two-way communication process, whereas outreach can be unilateral communication. Example: collaborative problem solving, visioning.

The end game of public engagement should be empowerment: creating a real and meaningful mechanism for public input to be heard far enough upstream in science and technology policy making and program development to influence decisions.” (Source: scienceprogress.org)

Who is your audience? When designing outreach projects, it is important to identify the audience (or “stakeholders”) for your research results. The level of public interaction will depend on the nature and focus of the research. Audiences for current Sea Grant activities include commercial fishermen and aquaculturists, natural resource agency leaders and staff, municipal officials, coastal property owners, tourists and tourism-related businesses, and state and federal legislators.
